	Care training programme is delivered to all relevant staff before going live and this will be a non-negotiable prerequisite. The portal is piloted with a defined subset of new customer applications to identify integration issues before full rollout. Email-based submission is formally retired for pilot participants	
Phase 4. Full Go-Live and Stabilisation (Weeks 16–19)	The ServiceNow onboarding portal goes live for all new customer applications. Email-based submission is fully retired across all departments. The monthly KPI reporting cycle begins. A post-implementation review is conducted at week 26 to assess KPI performance against Section 6.2 targets and identify any adoption gaps or system issues requiring remediation.	• Go-live sign-off • First monthly KPI report • Post-implementation review report.

7.3 Feasibility assessment

7.3.1 Technological feasibility

The recommended solution is technologically feasible within Company X's current systems landscape. The ERP Specialist confirmed that ServiceNow already supports the workflow architecture required which is guided routing, SLA tracking, ticket reassignment between assignment groups, and automated status notifications. She further confirmed that the current ERP System supports scripts that block users from progressing between process statuses if prerequisite steps have not been completed, enabling the system-enforced sequencing controls without new technology procurement. The portal can be developed as a ServiceNow application integrating with the existing ERP system and AEB screening infrastructure. No significant capital expenditure is required since the solution builds on existing licensed systems.

7.3.2 Schedule feasibility

The 19-week timeline is achievable given that SOP development can commence immediately and portal development begins only after the technical brief is complete. The critical path runs through portal development in Phase 2. A phased go-live approach reduces schedule risk by identifying integration issues during piloting before full rollout. The timeline is designed to complete before the cloud-based version of the current ERP system goes live in October 2026, avoiding the change saturation risk that would arise from simultaneous major system transitions.

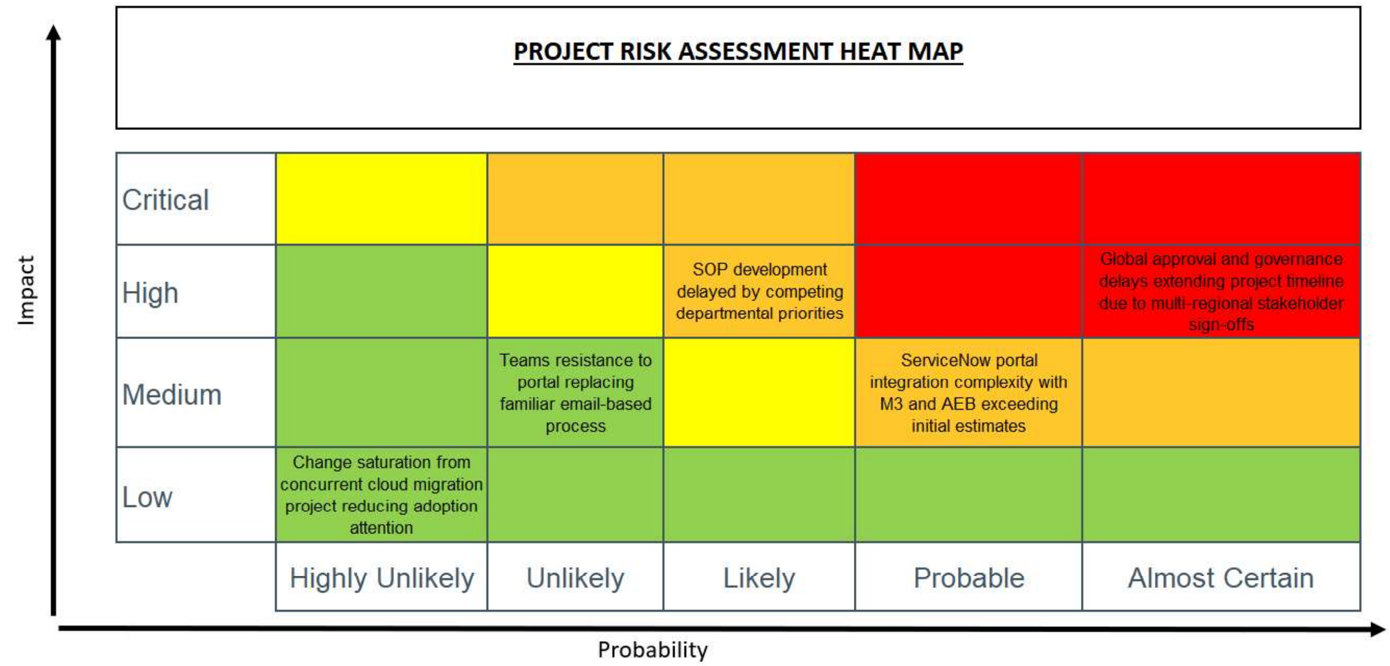
7.3.3 Organisational feasibility

The primary organisational constraint is staff time for SOP development and training delivery alongside existing workloads. The Regional Credit Manager identified this as manageable if Phase 1 activities are prioritised and departmental managers are engaged from the outset. The Customer Care training programme requires dedicated time allocation for staff operating under existing workload pressure, which must be scheduled before go-live rather than concurrently with it.

7.3.4 Return on investment (ROI)

A full quantitative ROI calculation is not possible because specific financial figures are confidential. However, the directional ROI case is strong. Implementation costs are primarily staff time for SOP development, training, and portal configuration and no capital expenditure on new systems is required. Financial benefits operate through three mechanisms. Firstly, a reduction in rework costs currently absorbed by Customer Care, Trade Compliance, and Credit Control. Secondly, a reduction in revenue leakage from customer abandonment and delayed activation. Lastly, reduction in compliance exposure that carries potentially irreversible financial and reputational consequences. The Financial Controller confirmed that current process failures produce material financial losses on a recurring basis. The break-even point is therefore likely within the first year of full operation.

7.4 Project risk analysis



7.5 Human impact of the change

The recommended solution does not require structural reorganisation. The primary change is the formalisation of cross-functional accountability through documented SOPs, which makes existing roles explicitly responsible for defined activities rather than relying on informal practice.In terms of changes to job descriptions, the Customer Care team's role expands to include formal documentation verification responsibilities under the new SOPs, making submission quality a measurable and accountable activity for the first time. The Trade Compliance Officer's performance becomes measurable through ServiceNow SLA tracking which would allow management to assess screening turnaround objectively, resolving the current situation where performance is contested but unmeasurable. The Credit Control team's handover responsibilities to Master Data Support becomes formalised through ServiceNow ticket management, replacing informal email coordination. Customer Care staff require structured training on portal usage, documentation requirements, and SOP responsibilities before go-live, as a prerequisite for implementation. All contributing departments require orientation on their specific SOP responsibilities and escalation pathways. The IT and system administration team requires technical training on ServiceNow portal configuration and ERP system integration to support and maintain the system after going live.

8. Conclusion

The analysis shows that customer onboarding is a critical control point in the Order-to-Cash environment rather than a routine administrative task. The current process suffers from incomplete
