

5.3 Mapping of interventions to problems and risks

Risk/ Problem identified	Recommended intervention	How the intervention addresses the risk/problem
Incomplete customer applications	ServiceNow onboarding portal with mandatory fields	Prevents submission of incomplete documentation and decreases rework
Commercial pressure to bypass screening	System-enforced sequencing in ServiceNow portal	Prevents order creation until onboarding is complete, eliminating opportunities for commercial bypass.
Approval bottlenecks from key-person dependency	SOPs with defined delegation framework and escalation pathways	Establishes documented backup approvers and escalation routes, reducing reliance on specific individuals
Fragmented POD repository and incomplete ScanCo adoption	SOPs and document governance standards	Standardises document capture and retrieval across departments.
Absence of defined onboarding service level	Portal SLA tracking and automated notifications	Establishes measurable turnaround expectations and improves visibility.
Regulatory non-compliance through premature order placement	System-enforced order block	Replaces human discretion with a structural compliance gate.
FICA re-screening burden causing onboarding backlog	Consolidated onboarding documentation pack within the portal	Reduces repeated collection of previously validated information.
Loss of institutional knowledge	SOPs, work instructions, and process ownership	Embeds process knowledge into the organisation rather than individuals.
Customer abandonment during onboarding	Guided portal submission and real-time tracking	Reduces friction and improves customer experience
